

Safer Product Chemistry, Safer Environments

Spartan Chemical Company, Inc.

Steve Swigart - Chairman & CEO

For centuries, providing healthcare was the sole responsibility of doctors, pharmacists, and the health care institutions. The rest of the global institutions, industrial, and commercial establishments were only focused on product and productivity. Only recently did some management begin to understand and correlate healthy buildings to healthy occupants — and connect the dots — understanding that this correlation, in itself, leads to higher productivity.

Spartan Chemical is an international manufacturer with compounding plants in eight countries. We have united these resources and shared technology with our sister companies to create safer and more sustainable cleaning solutions. Spartan has taken it upon itself to manufacture products that reduce the carbon footprint in industrial, institutional, and commercial facilities, providing a safer and cleaner environment for both work and play.

The degree of success is measurable. There are documented studies of schools and federal facilities that have reduced the number of sick days. Studies prove that the use of Green products and procedures reduces

asthmatic and bronchial afflictions, while increasing productivity and general health of the occupants.

Spartan Chemical manufactures cost-effective cleaning products that not only meet the Green criteria of GS-37, but are compounded from renewable raw materials such as soy, corn, and palm oils. It's safer chemistry and extends the products' benefits beyond the normal Green standards.

The U.S. Green Building Council established the Leadership in Energy and Environmental Design (LEED) standard. Spartan Chemical, with its resources and dedicated personnel, has manufactured products designed to exceed these standards to provide future generations with a safer working environment. Healthy buildings go hand-in-hand with healthier occupants.

Sincerely,

Steve Swigart, Chairman & CEO
